

Hello,
Many thanks for your tech test.

1. Kindly find attached below (Interwoven with your requirements) my response
2. A quick summary of my solution architecture (What I have done and what I havent done) according to the test requirements
3. Also kindly find attached to the repository, my solution and readme file
4. FINALLY: For the sake of time, I have cut some corners in my final solution e.g. setting the main table columns (that are not being used) as null in both the classes and not used in my test, (In a real life senario, it would be different)

I have taken time to explain why and where. (As the requirements, insist I should not "OVER-ENGINEER THE SOLUTIONS"

I have tried to clean up the code, to ensure its professionally done and no dead code hanging around. I would ask that the reader to please note. Thank you

I hope you find it favourable

Kind regards
Ehi Izevbaye

Microsoft Full Stack (Web and WPF) developer (SDLC)

Technical Test – Movie API

The test is to assess your coding skill and identify your strengths and weaknesses. There is no specific time limit for this technical test, however, it should be completed within a practical time.

I have uploaded my solution to my personal github repo here
www.github.com/izevbaye/optix

You should consider:

- Choose the appropriate tech stack for the role you are applying for.
- Pay attention to how you structure your project(s).
- Remember "KISS"! Don't overengineer the solution, remember to complete the basic requirements first using best practices and then if you have time, you can go back and improve the architecture later.
- Think about code reuse, readability, testing, patterns and add some exception handling **if you can.**

Since the requirements says "...if you can..."

I did not add exception handling using try catch, rather, I injected a global exception and logging capabilities, with the above concept of code reuse, SOLID Principles and code abstractions

I added a demo class under, this namespace called
`GlobalExceptionHandlerMiddleware Optix.Domain.Library.Models`

Based on this article

<https://learn.microsoft.com/en-us/aspnet/web-api/overview/error-handling/web-api-global-error-handling>

- Think about deploying the application, it should be easy to deploy for example you could use docker and docker-compose files.
Solution was built with the new version of .NET 8 ASPIRE, so docker comes in as standard. And run in my docker desktop containers.
- If you have any questions or get stuck on anything at all, please reach out to us!

The Task

Design an API that allows users to query and consume values from a database of your choice, using the dataset provided. **If you really want to show off** and take things further, build a Front End (UI) that uses your API.

Everyone likes to show off, what they are comfortable with.
So, Yes, would like to show off a bit. I used the latest version of .NET ASPIRE and blazor web UI, using APPHOST orchestration capabilities, which is something I have been following since the first launch in blazor hybrid and now the new .net ASPIRE.

I did not use the default .net ASPIRE web UI out of the box, rather. I built a blazor (Identity) app and added orchestration to it with docker

Dataset Url: <https://www.kaggle.com/datasets/disham993/9000-movies-dataset>
(If you would like to use a different source entirely then please let us know)

Must have(s)

- "As a user I want to search movies by title/name"
- "As a user I want to be able to limit the number of results per search"
- "As a user I want to be able to 'page' through the list of movies"

Added all of the above with unit testing and front end display using blazor

Should have(s)

- "As a user I want to filter movies by genre"

Added

Could have(s)

- "As a user I want to filter movies by actors"
- "As a user I want to be able to sort movies by title/name or release date"

Since its a "COULD HAVE" I did not Add, this. Rather I added other capabilities, which are mentioned above

Sharing

Once completed please provide us a link to the repository that we can access and clone the solution from.

If you have any questions regarding the tech test, even if you get stuck, please don't hesitate to reach out and ask us!

SOLUTIONS ARCHITECTURE

Summary: The solution was engineered with ASP.NET CORE ASPIRE version 8.0 C#

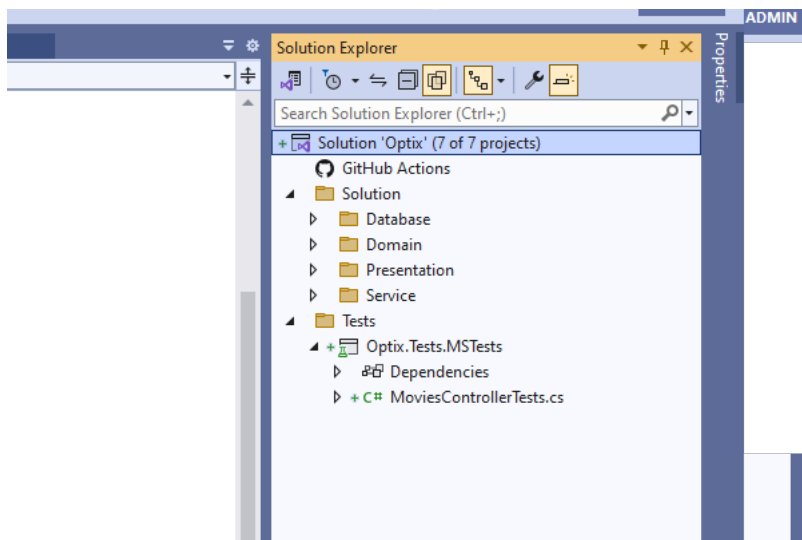

Its a micro -services architecture, with separation of concerns

1. General Solutions overview (2 Folders) namely

- (I) solutions - This contains all the solutions folder
- (ii) tests – contains the unit tests

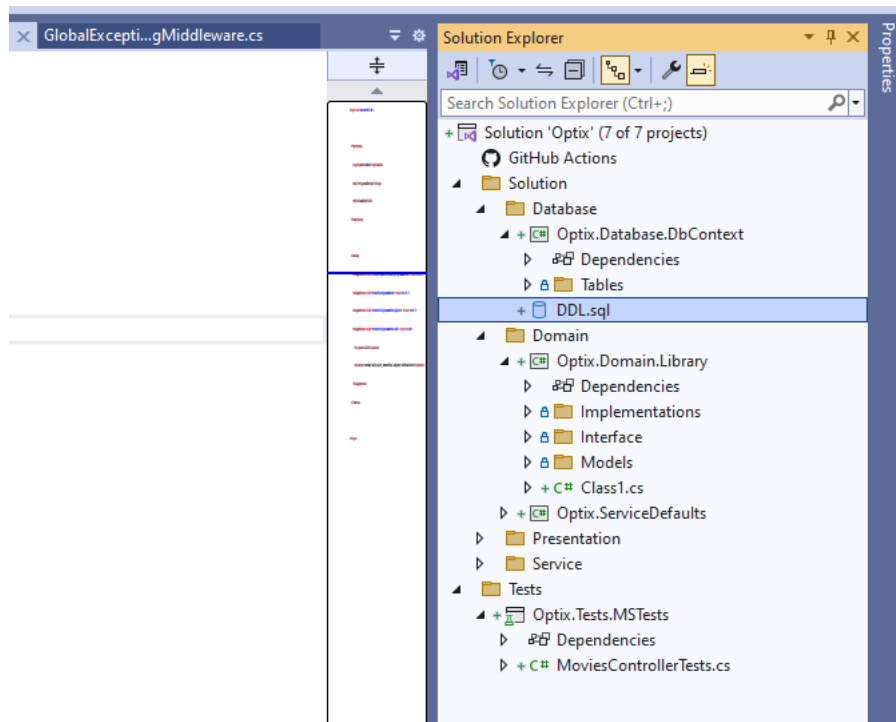

2.1 – the solutions folder contains 4 solutions. Namely

(a) Database folder : Which contains the DDL sql (Data Definition Language) script, which generates the database script

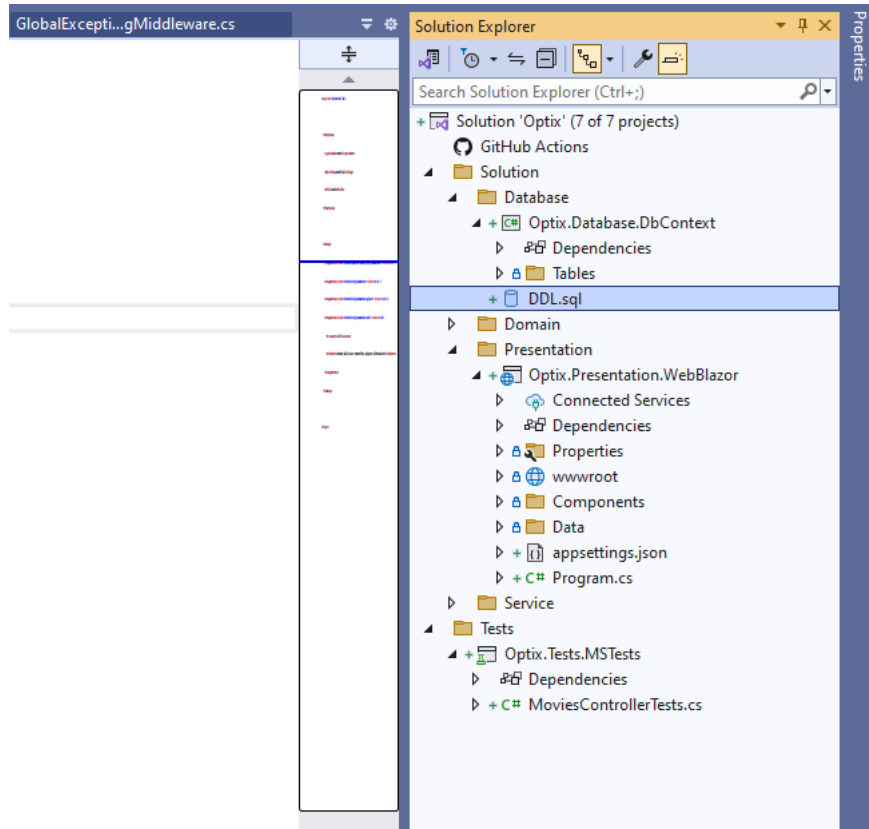

(b) Domain folder: Which contains both the Library and ServiceDefaults projects.

The Library project, contains the classes, Interfaces and interface implementations for the front end and Blazor projects. Which are injected in the DI containers

The ServiceDefaults project is a part of the newly released .NET 8.0 ASPIRE ASP.NET CORE orchestration projects.

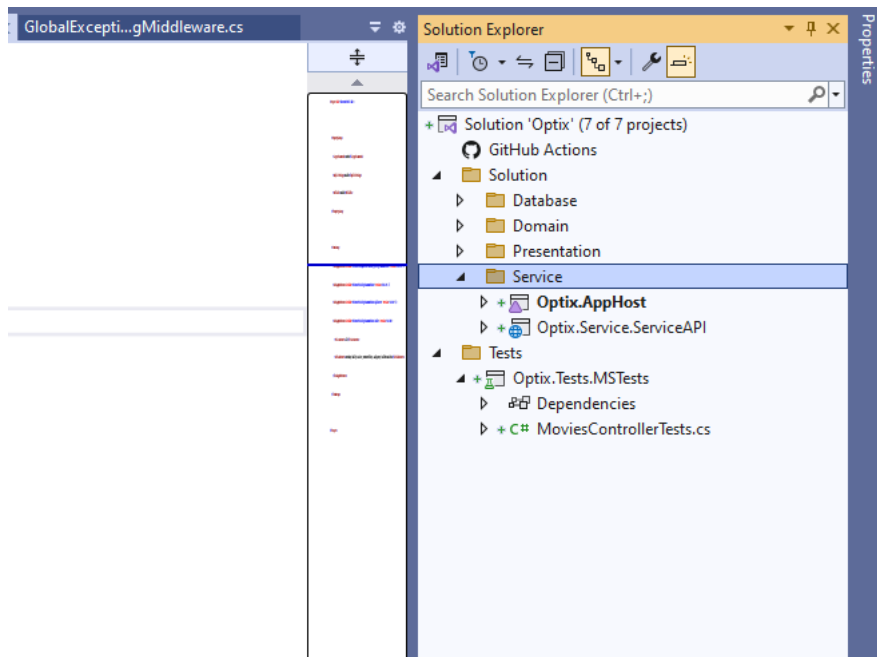

3.1

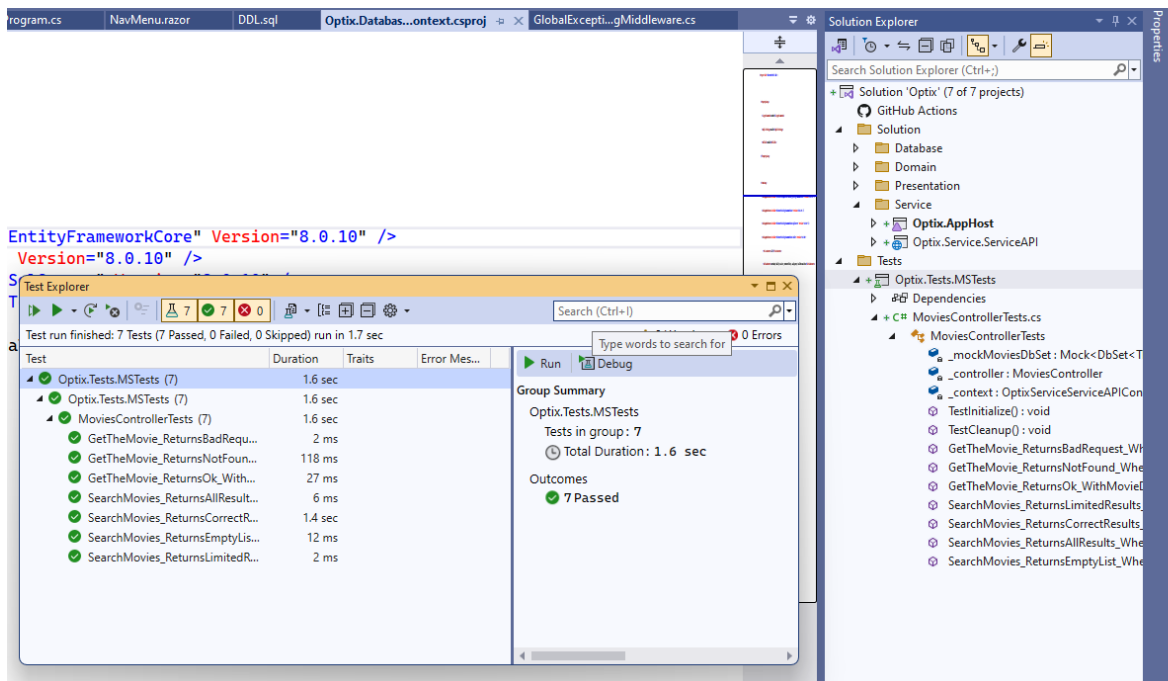

PRESENTATION FOLDER – This contains the web project. Which was done with Microsoft. .Net Blazor

4.1. Service folder.

This contains both the test requirement for the Microsoft .NET Web API2, service project and the ASP.NET ASPIRE 8.0 AppHost orchestration solutions

5. TESTS FOLDER

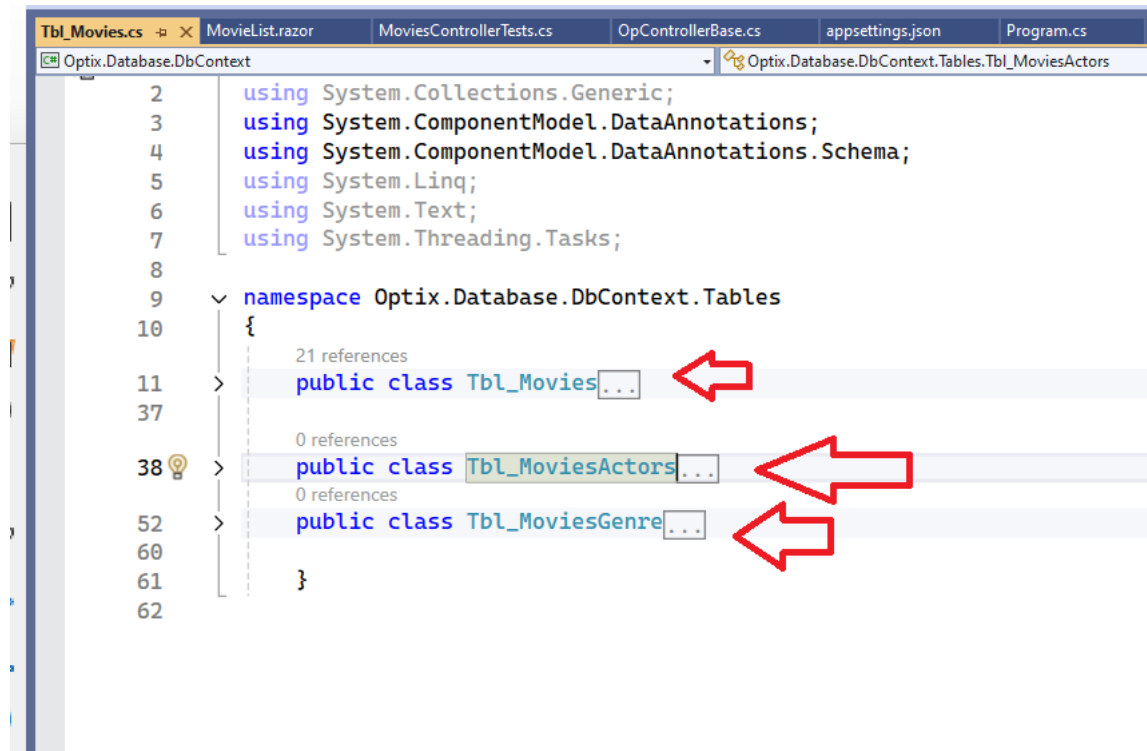

THINGS I HAVE NOT DONE. With regards best practices

KINDLY NOTE

Things I have not done (As part of the requirement is not to over-engineer.....) For times sake and also, I was not advised to do so.

1. I kept all the classes in one file

I

2. I created RDBMS Relationships in the database table and further engineered my tables. e.g. the Genre column, contains “en” in the online example, which I feel should be an enum value or a FK relationship to the Genre table (which is what I have done)

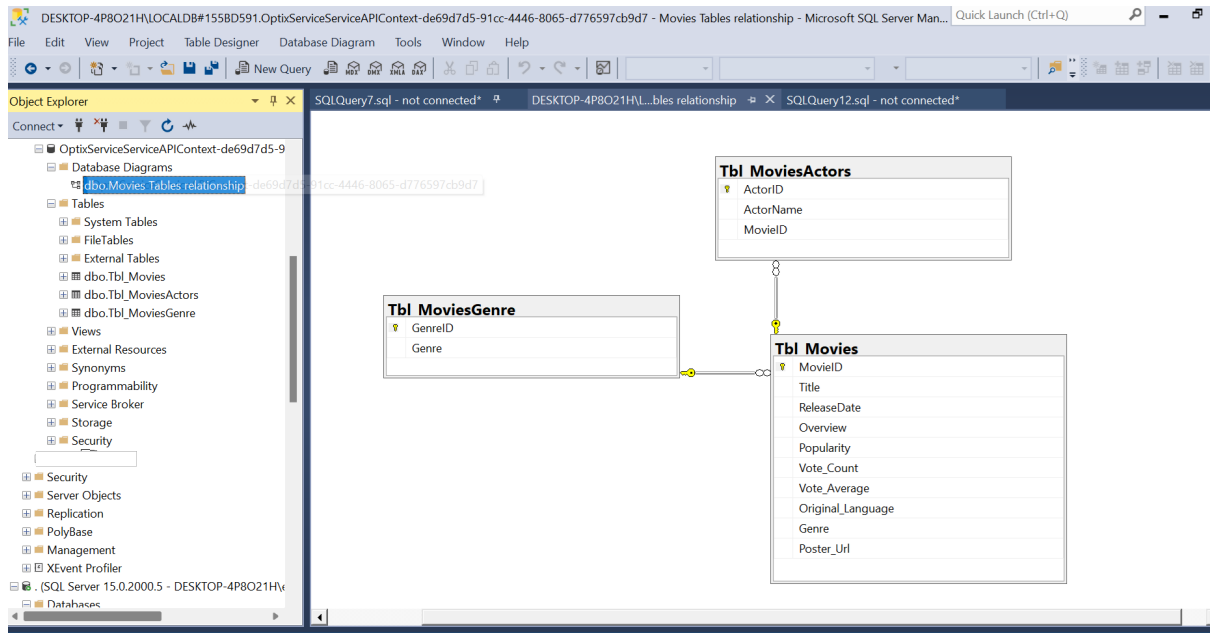

3. I have also created a 2nd table called Tbl_MoviesActors, as it would be wrong to enter the values into the main table, (which defeats the purpose of normalization)

4. I have created navigation properties in the classes as `LISTS<Tbl_Movies>` and added them as PK/FK constraints

5. I have not used either DB or Code first approach for the sake of time and it was not requested

6. I have not created a Migrations project, neither have I used it in this instance

DATABASE RELATIONSHIPS

FINALLY TO RUN THE SOLUTIONS

1. Requirements:

- Visual Studio 2022 or higher using .NET 8.0 or higher
- Docker desktop

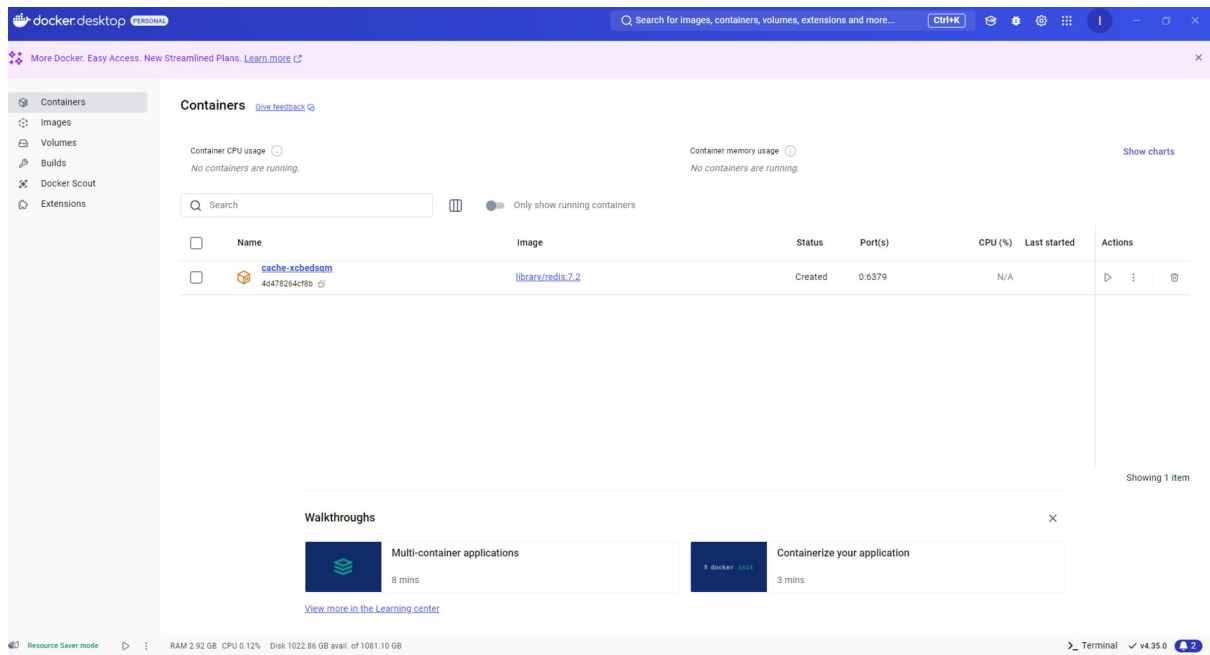

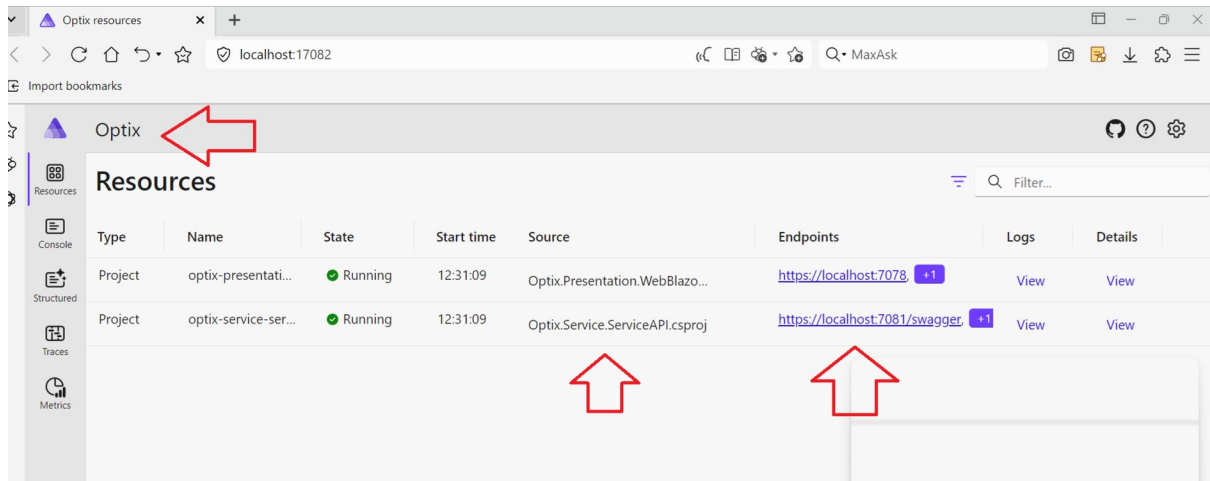

There are 2 ways to run it.

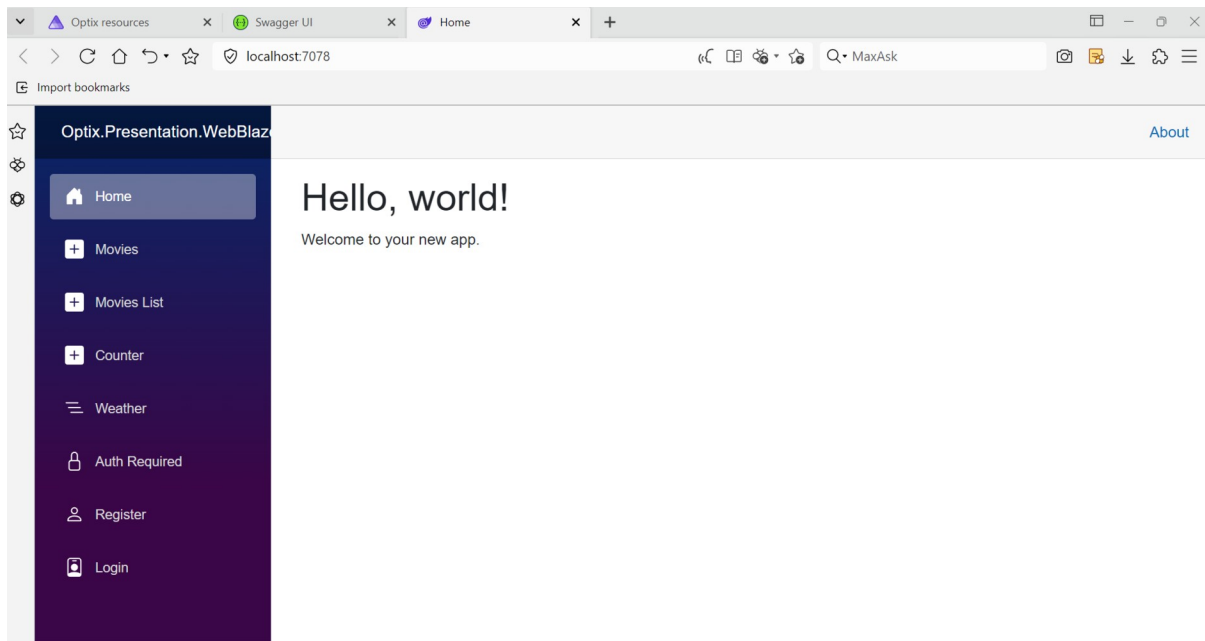

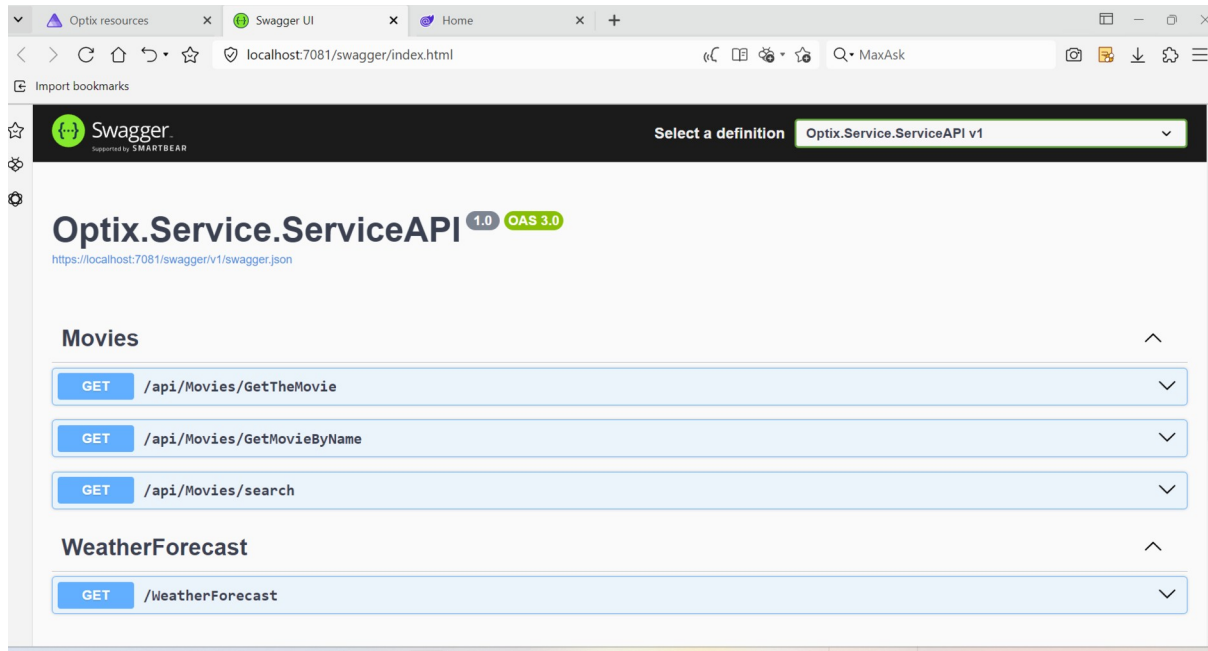

OPTION 1 – Ensure the project Optix.AppHost is set as the startup project and click run

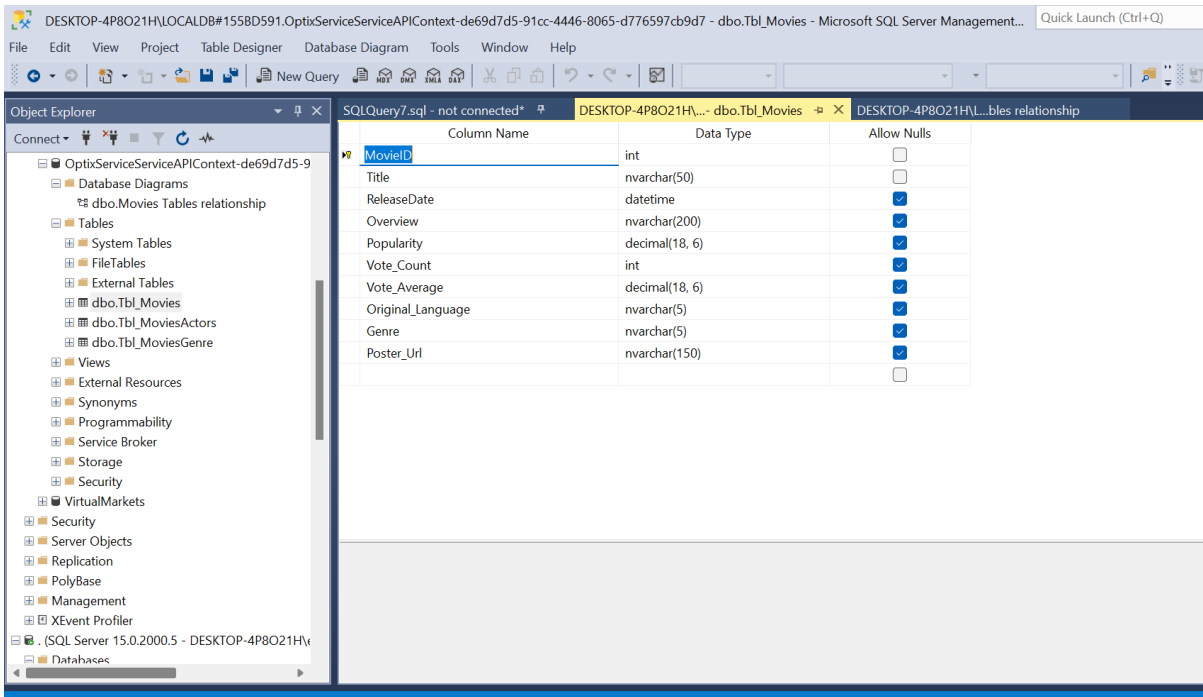

OPTION 2 – Set the Optix.Service.ServiceAPI is the startup project and click the Run button

* Ensure Docker is up and running

SCREENSHOTS

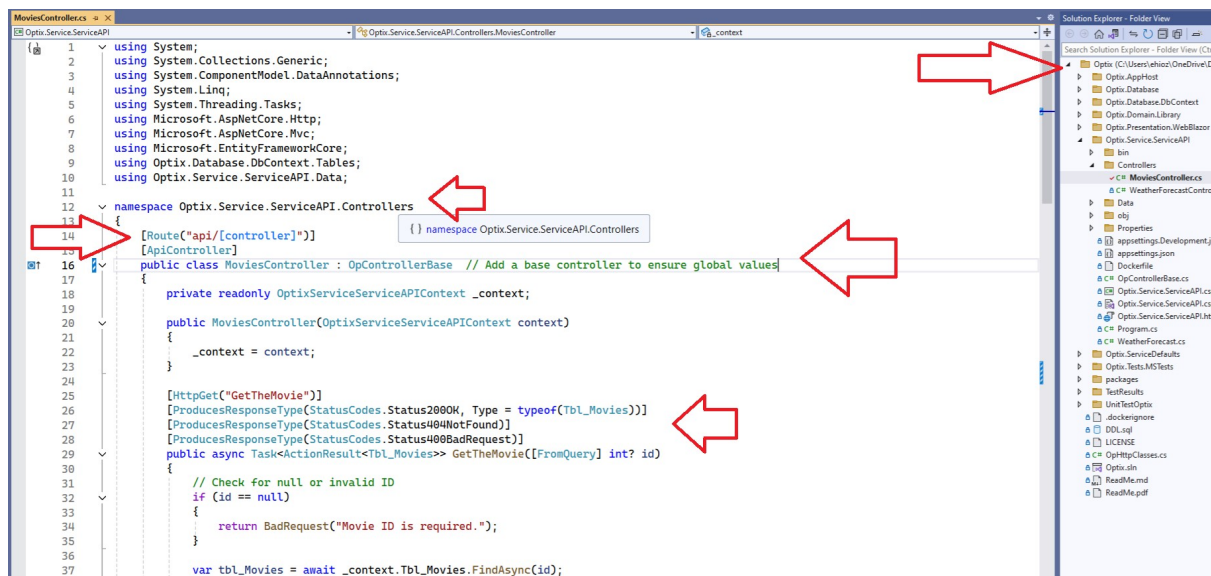

The screenshot displays the Microsoft SQL Server Enterprise Manager interface. The 'Object Explorer' on the left shows the database structure, including 'Database Diagrams', 'Tables', 'Views', and 'Security'. The 'dbo.Tbl_Movies' table is selected. The 'SQL Query 7.sql' window shows the table's columns and data types.

Column Name	Data Type	Allow Nulls
MovieID	int	<input type="checkbox"/>
Title	nvarchar(50)	<input type="checkbox"/>
ReleaseDate	datetime	<input checked="" type="checkbox"/>
Overview	nvarchar(200)	<input checked="" type="checkbox"/>
Popularity	decimal(18, 6)	<input checked="" type="checkbox"/>
Vote_Count	int	<input checked="" type="checkbox"/>
Vote_Average	decimal(18, 6)	<input checked="" type="checkbox"/>
Original_Language	nvarchar(5)	<input checked="" type="checkbox"/>
Genre	nvarchar(5)	<input checked="" type="checkbox"/>
Poster_Url	nvarchar(150)	<input checked="" type="checkbox"/>

The screenshot shows the Visual Studio IDE with the 'MoviesController.cs' file open. The code is annotated with red arrows pointing to specific parts: the 'ApiController' attribute, the 'ApiController' base class, the 'HttpGet' attribute, and the 'FindAsync' method call.
